

# PLAYING POKER USING NEURAL NETWORKS

Delkhaz Ibrahim

Loraina Lampley

Brandon Lowery

Jeremy Watts

- ▶ Our goal was to train two different kinds of neural networks to classify poker hands and test which kind of neural net is superior for the task.
  - ▶ Feed-Forward vs Convolutional
- ▶ In order to play poker, an agent must be able to recognize the hand that it has, otherwise it will be making poor choices.
- ▶ We wanted to make a driver that would allow a human user to play a simple 5-card draw game against the superior neural network.
  - ▶ We predicted that a feed forward neural network would outperform the convolutional neural net.

## THE OBJECTIVE

- ▶ “Poker Hand Dataset” from UCI Machine Learning Repository
- ▶ <http://archive.ics.uci.edu/ml/datasets/Poker+Hand>
- ▶ A simple but robust data set that captures every possible permutation of a given 5 card hand (there are 480 possible Royal Flush hands as compared to 4)
- ▶ Cited to be a challenging data set for classification algorithms

## DATA SET

<b>ROYAL FLUSH</b> This hand contains five cards in sequence, all of the same suit.	    
<b>STRAIGHT FLUSH</b> This hand contains five cards in sequence, all of the same suit.	    
<b>4 OF A KIND</b> This hand contains all four cards of one rank and any other unmatched card.	    
<b>FULL HOUSE</b> This hand contains three matching cards of one rank and two matching cards of another rank.	    
<b>FLUSH</b> This hand contains all five cards are of the same suit, but not in sequence.	    
<b>STRAIGHT</b> This hand contains five cards of sequential rank in at least two different suits.	    
<b>3 OF A KIND</b> This hand contains three cards of the same rank, with two cards not of this rank nor the same as each other.	    
<b>2 PAIR</b> This hand contains two cards of the same rank, plus two cards of another rank.	    
<b>1 PAIR</b> This hand contains two cards of one rank, plus three cards which are not of this rank nor the same.	    
<b>HIGH CARD</b> made of any five cards not meeting any of the above requirements.	    

# POKER HANDS

Source: [www.wsop.com/poker-hands](http://www.wsop.com/poker-hands)

- ▶ Royal Flush: 0.000154%
- ▶ Straight Flush: 0.00139%
- ▶ Four of a Kind: 0.0240%
- ▶ Full House: 0.1441%
- ▶ Flush: 0.1965%
- ▶ Straight: 0.3925%
- ▶ Three of a Kind: 2.1128%
- ▶ Two Pair: 4.7539%
- ▶ One Pair: 42.2579%
- ▶ High Card: 50.1177%

## TRUE ODDS

Differs from the training and data set.

Straight Flush & Royal Flush is oversampled in training (14 and 129 times more likely respectively)

Cumulative prob. above 1 pair is 7.62%

- ▶ The idea of using a neural network to play a game is engaging
- ▶ Poker is a straightforward game to understand and play
- ▶ Poker provides a challenging task for traditional classification algorithms that seems well-suited for a neural network to solve
  - ▶ The reason is because the poker data set is “imbalanced” to favor lower ranked hands
- ▶ Our team wanted to find out if a convolutional neural net could successfully compete in this task against a traditional feed forward net

## PROJECT MOTIVATIONS

- ▶ Saves time thinking of and implementing an appropriate classification algorithm to exhaust all possibilities of a hand
- ▶ Given a good enough classifier, the same neural network can be used for more than one variant of poker
- ▶ The same network can also be used for multiple different drivers as long as the software supports the same framework (i.e. Keras)
- ▶ If the goal is to make a poker-playing agent that *acts* like a human, then it would be most accurate to have an agent that does not perfectly classify the hands that are presented (mis-read)

## WHY USE A NEURAL NETWORK?

LOL JUST CODE IT  
EXPLICITLY

NO

- ▶ Develop and train the two distinct neural networks
- ▶ Run a sample of 1000 games between the two of them
- ▶ Determine which of the neural networks is superior from this data
- ▶ Develop an interactive demonstration to pit a human player against the superior neural network.

## KEY AIMS

- ▶ Jeremy and Delkhaz went to work preparing the neural networks, training them and testing them
- ▶ Brandon constructed a driver program on top of a Python poker library called “Treys”
  - ▶ This library allowed for “pretty printing” the suits of the hand and an evaluation mechanism to determine who wins
- ▶ Loraina kept in contact with the team and began working on the paper to collate and publish the results

## STRATEGY

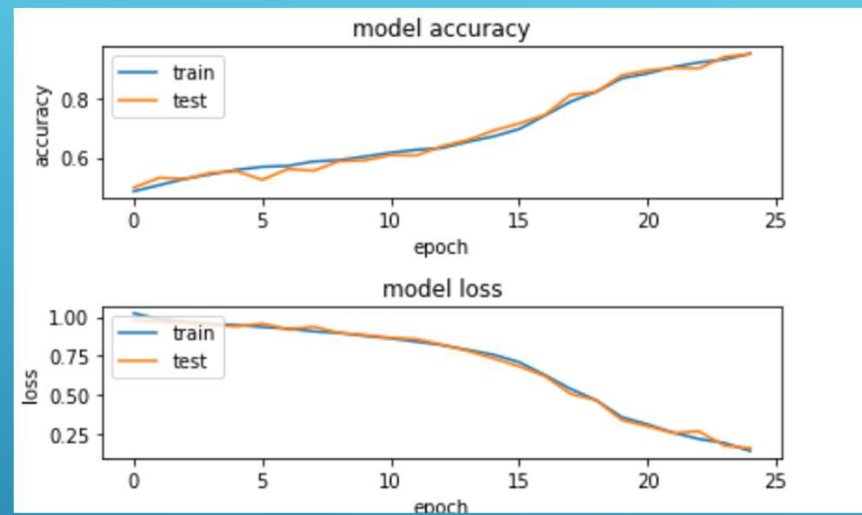

- ▶ A convolutional neural network and a feedforward neural network were produced with comparable accuracy (96% vs 98%)
- ▶ A finished driver was created that could test the two networks to find the “real world” difference between the two given their difference in accurately classifying a presented poker hand
  - ▶ Additionally, a human player can interact and play against the Neural Network
- ▶ The result of this testing seemed to reinforce the original hypothesis that the feed forward neural network would be superior (FF wins 52.1% of the time)
- ▶ The methodology of the experiment with the corresponding results were published in the paper.

## RESULTS

## Feed-forward

## Convolutional

## RESULTS

FFNN wins: 52.1% of the time.  
CNN wins: 47.6% of the time.
